# Trends In Labor Force Participation

June 2013

Daniel Sullivan  
Federal Reserve Bank of Chicago

# Labor Force Participation Rate, Trend vs. Actual

---

Ages 16+

# Main Points

---

- **Participation is trending down for two reasons**

- Demographics – we're getting older
- Long-running behavioral trends – participation for most narrow demographic groups has been dropping steadily over time

- **Nevertheless, 2012 participation is below its long-term trend by 1.2 percentage points**

- Even accounting for the high unemployment rate it is 0.67 percentage points below trend

- **Groups especially far below trend**

- The young
- Those with low education
- Older workers are bucking the trend

# Participation By Age and Sex

2012 Labor Force Participation Rates and Change in Population Share, by Age (percent)

**Ages 55-64**  
(percent)

# Labor Force Participation, By Age/Gender

---

Ages 65+  
(percent)

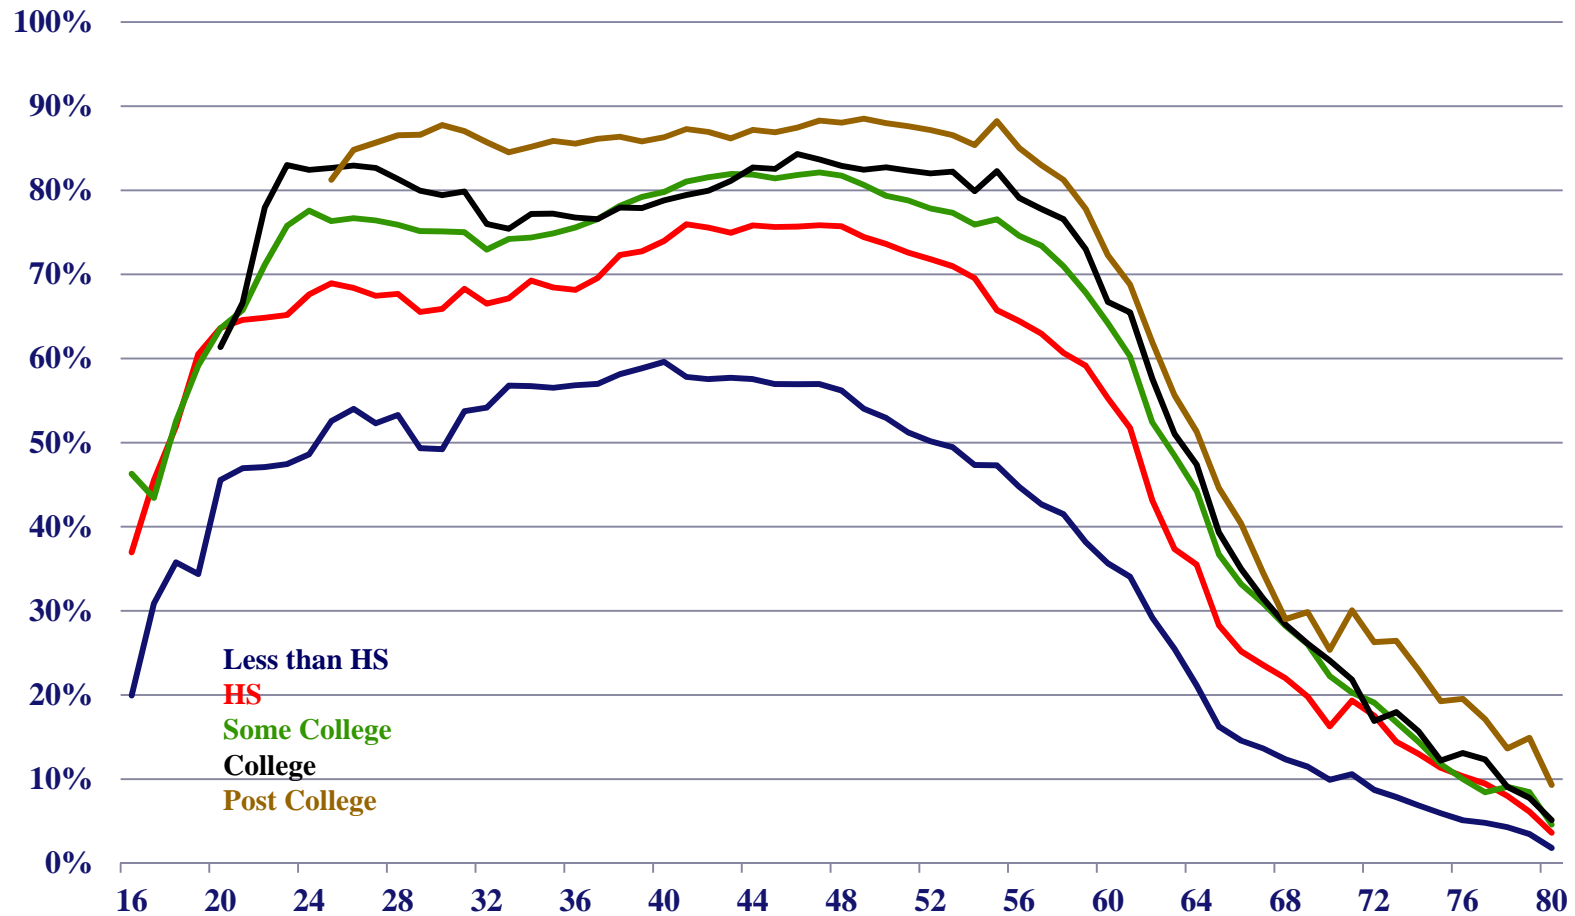

# 2012 Male Participation Rates By Education

# 2012 Female Participation Rates By Education

## Women

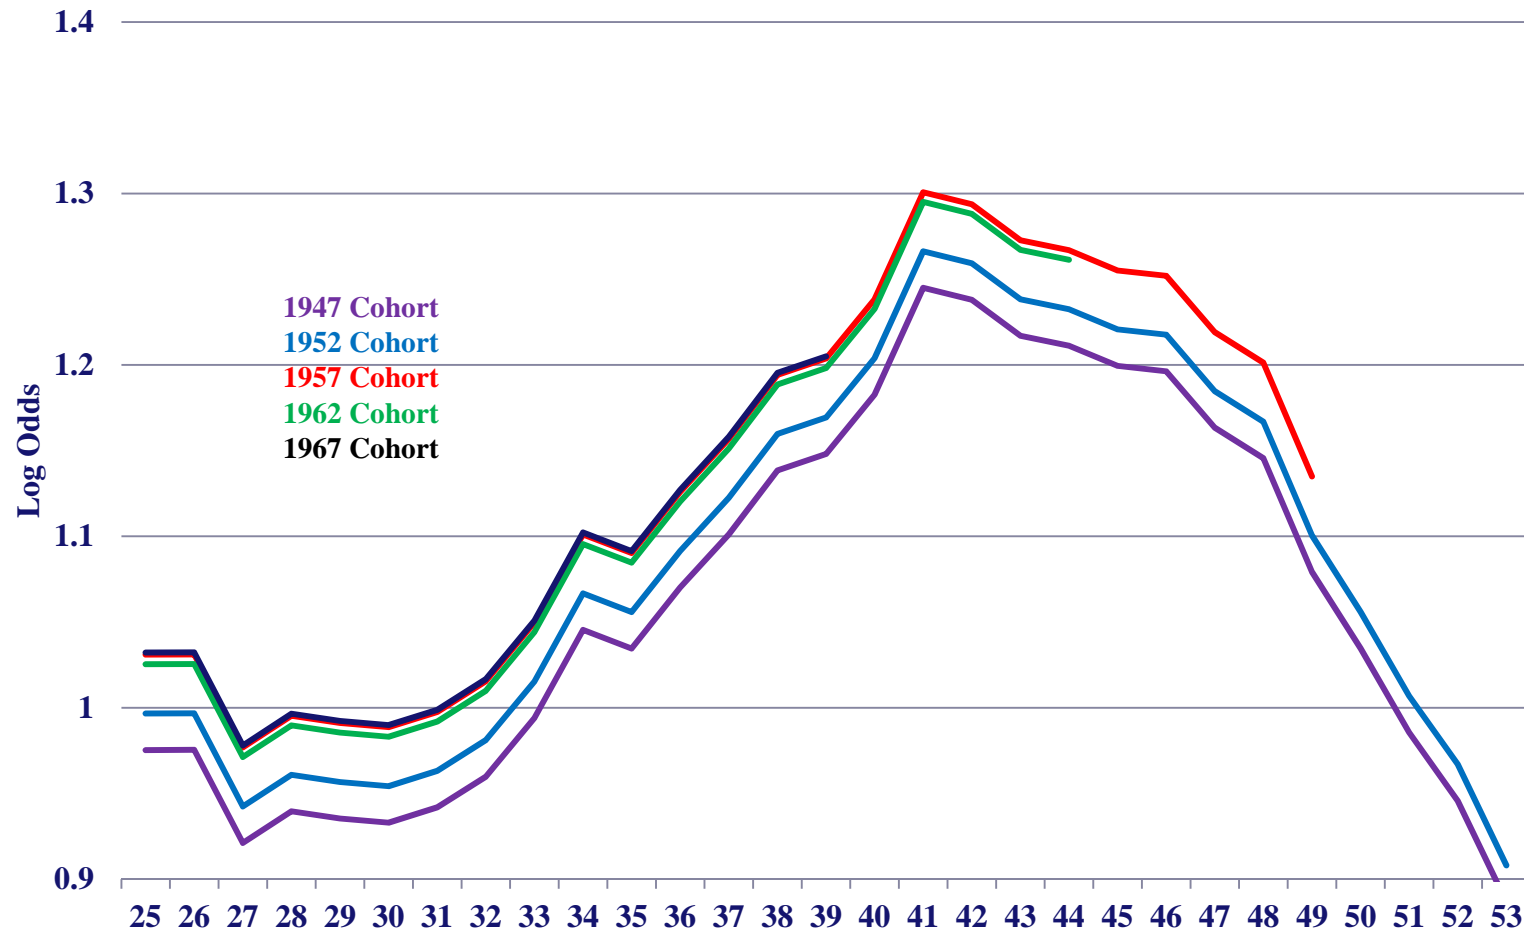

# Forecasting Demographic Group Behavior

---

- **Question: In 2007, how to forecast participation rates of 50-54 year old women in 2015?**
  
- **BLS Method: Extrapolate the historical time series for participation of 50-54 year old women using last 13 years (mixing cohorts)**
  
- **Cohort Method:**
  - Note that women who will be 50-54 in 2015 were born 1961-65
  - Compare the LFP of the 1961-65 birth cohorts to those of earlier cohorts at the same age
  - Assume cohort differences will persist at higher ages

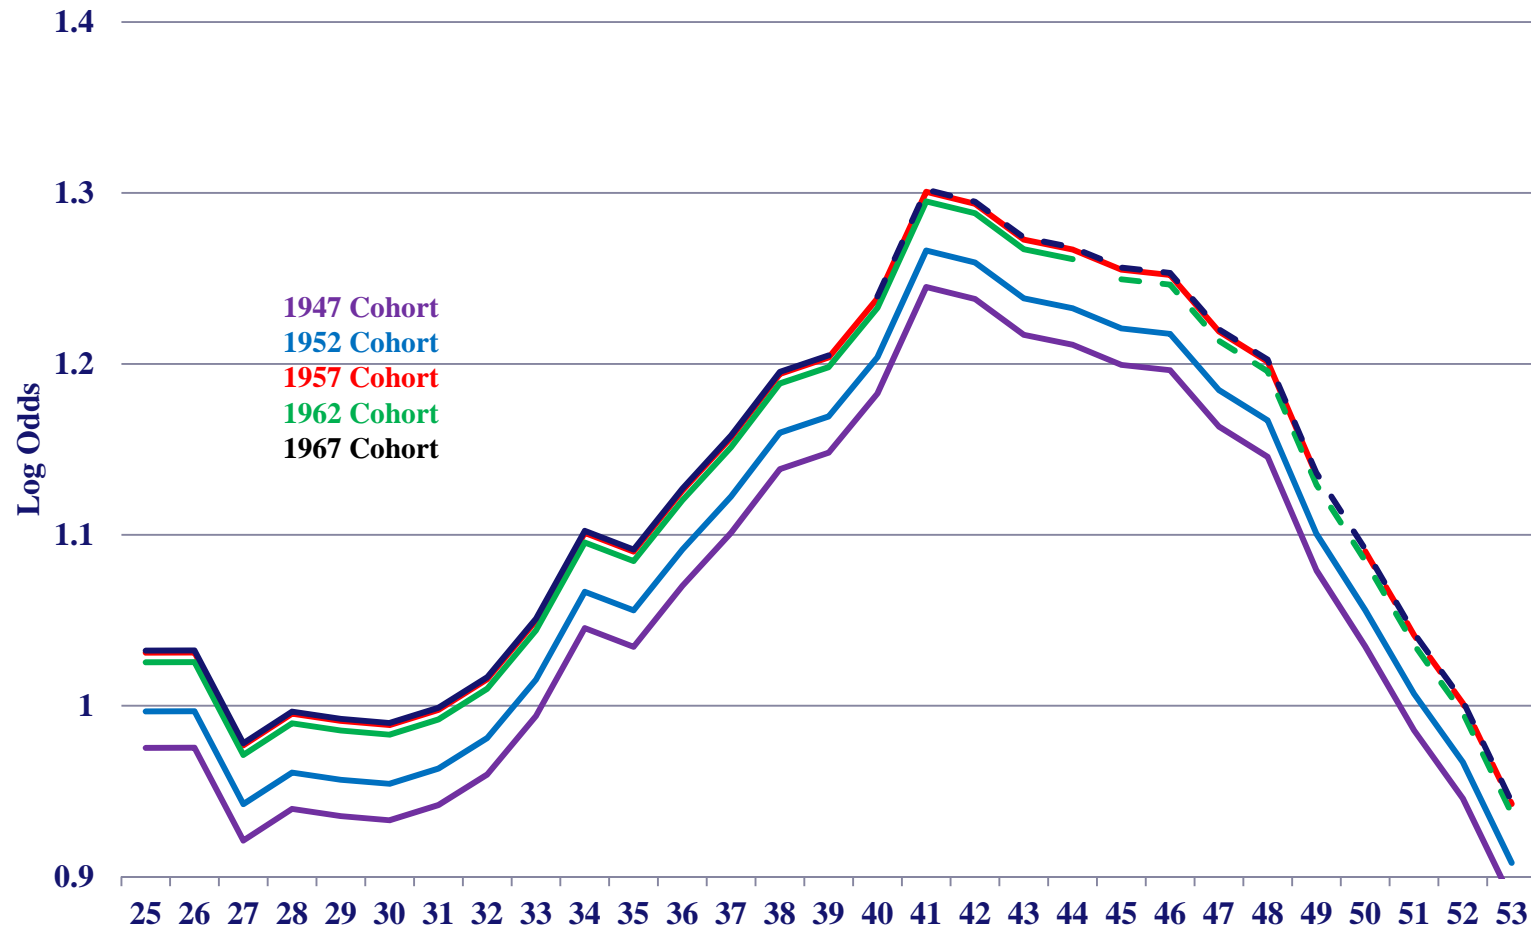

# Select Model Fit LFP Profile Projections

## White Female HS Graduate, 25-54

# Select Model Fit LFP Profiles Through 2007

White Female HS Graduate, 25-54

# Cohort-Based Projections

---

- **Above projections based on extensions of Aaronson and Sullivan, Chicago Fed Economic Perspectives, 2001**
  
- **Somewhat similar results to Aaronson, Fallick, Figura, Pingle, and Wascher, Brookings, 2006**
  
- **Methodological differences**
  - Estimates at individual level  
(Models estimated using CPS data 1987-2007)
  - Everything conditional on educational levels
  - Many details

# A Basic Logistic Cohort Model

---

$p_{sbai}$       **Prob individual i of sex s born in year b is in LF at age a**

$$\log\left(\frac{p_{sbai}}{1 - p_{sbai}}\right) = \beta_{sb} + \alpha_{sa} + x_{sbai}\gamma_s + z_{sba}\delta_s$$

$\beta_{sb}$       **Birth year cohort dummies**

$\alpha_{sa}$       **Age dummies**

$x_{sbai}$       **Race group dummies**

$z_{sba}$       **Age-specific controls**

**Estimated by age groups: 16-19, 20-24, 25-54, 55-70, 71-79.**

# Age-Specific Controls

---

## ■ Ages 16-24

- Real Minimum Wage
- Hourly Wage Ratio of 16-19 year olds to 25-54 year olds

## ■ Ages 25-54

- Fraction of population married with a Child 5 Years or Younger
- Fraction of population married with no Child 5 Years or Younger

## ■ Ages 55 and higher

- Gender specific life expectancies

## Extension: Condition on Education

---

$p_{sebai}$       **Prob individual  $i$  of sex  $s$  and education  $e$  born in year  $b$  is in LF at age  $a$**

**5 education categories: <HS, =HS, Some College, College, > College**

$$\log\left(\frac{p_{sebai}}{1 - p_{sebai}}\right) = \beta_{seb} + \alpha_{sea} + x_{sebai}\gamma_{se} + z_{seba}\delta_{se}$$

# Extension: Condition on Education

---

To forecast LFP, need educational attainment forecasts

$q_{sbai}^e$       Prob individual  $i$  of sex  $s$  born in year  $b$  has attainment of at least  $e$  at age  $a$  given attainment of at least  $e - 1$

$$\log \left( \frac{q_{sbai}^e}{1 - q_{sbai}^e} \right) = \beta_{sb}^e + \alpha_{sa}^e + x_{sbai} \gamma_s^e + z_{sba} \gamma_s^e$$

# Extension: Allow for Business Cycle Effects

---

$p_{sebai}$       **Prob individual  $i$  of sex  $s$  and education  $e$  born in year  $b$  is in LF at age  $a$**

$$\log\left(\frac{p_{sebai}}{1 - p_{sebai}}\right) = \beta_{seb} + \alpha_{sea} + w_{sea}\lambda_{se} + x_{sebai}\gamma_{se} + z_{seba}\delta_{se}$$

$w_{sea}$       **Annual unemployment gap (actual – CBO NAIRU)**

# A Decomposition

---

Let  $p_t$  = Overall trend LFP at time t

$p_{dt}$  = Trend LFP for demographic group d at time t

$f_{dt}$  = Share of population in group d at time t

Then

$$p_t = \sum_d f_{dt} p_{dt}$$

And

$$\Delta p_t = \underbrace{\sum_d (p_{d,t-1} - p_{t-1}) \Delta f_{dt}}_{\text{Demographics}} + \underbrace{\sum_d f_{dt} \Delta p_{dt}}_{\text{Behavior}}$$

# LFP By Education

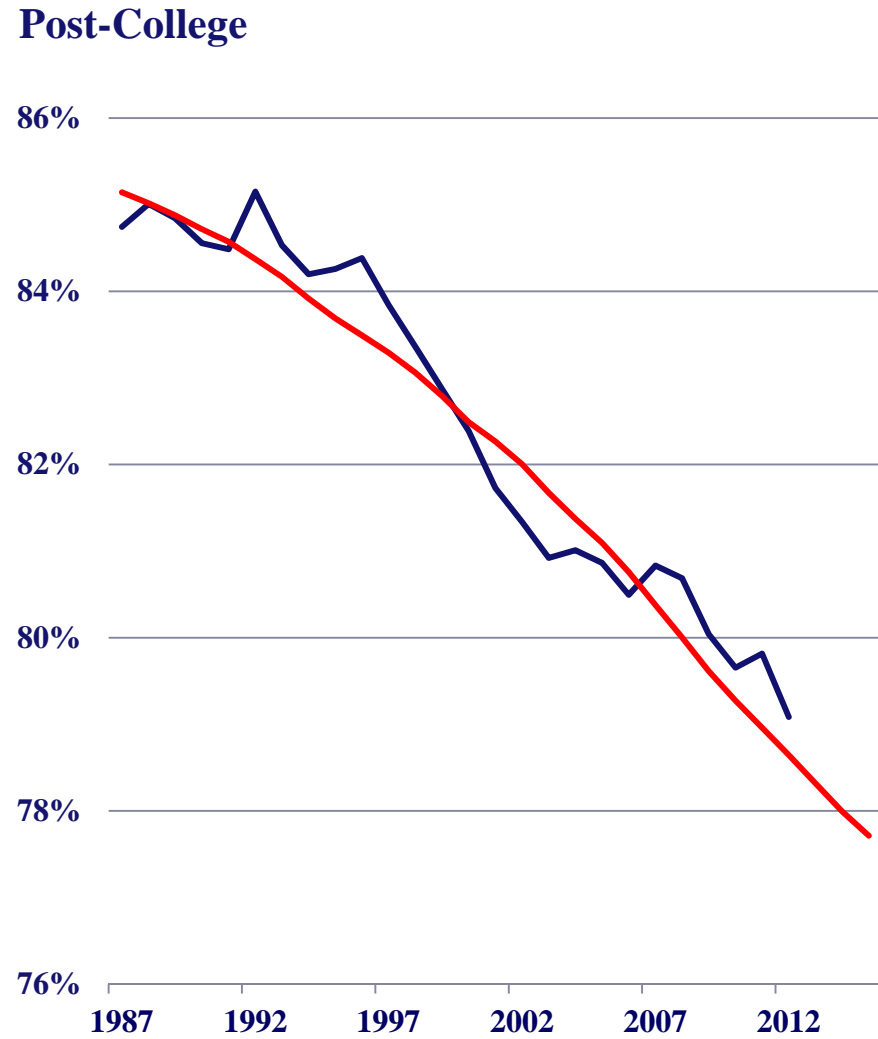

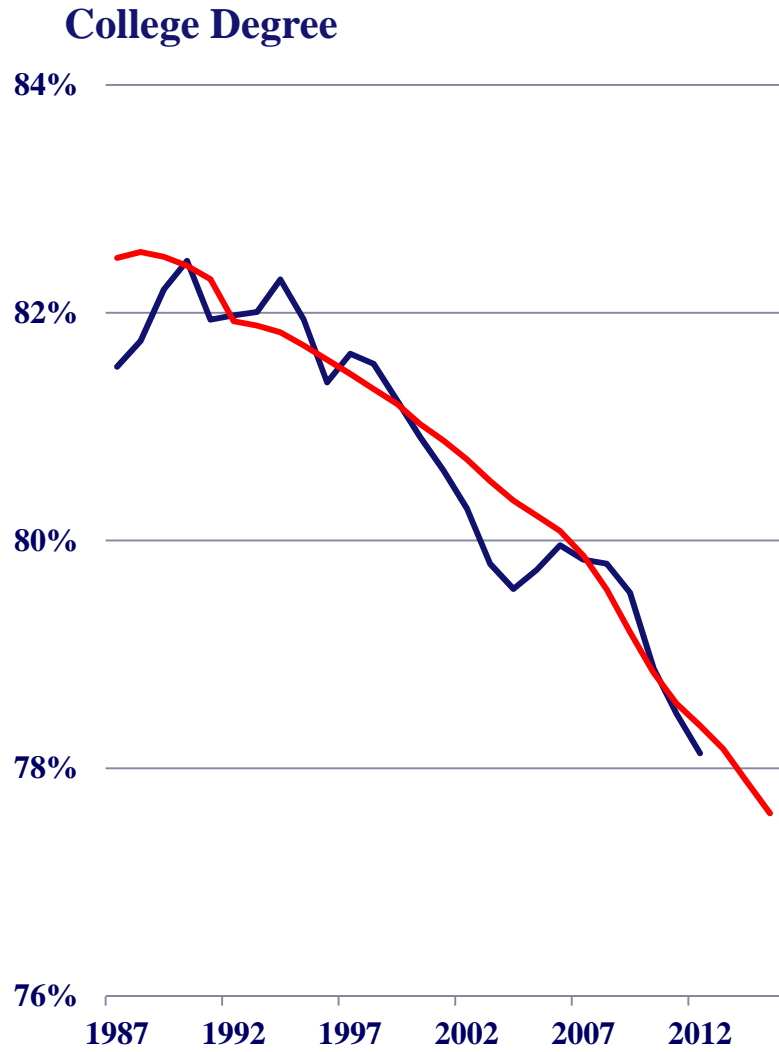

---

# LFP By Education

---

# LFP Gap By Education

(Actual LF – Predicted LF)

# Contribution to LFP Gap By Education

(LFP Gap \* Population Share)

# Possible Interpretation of Low Education Results

---

- **Housing boom may have temporarily stopped the slide of real wages for low education workers ...**
  - Possible interpretation of Charles, Hurst, and Notowidigdo (2012)
- **Temporarily holding up LFP**
  - And our trend estimates
- **After housing collapse, wages and LFP declined**
- **Another story: Downward nominal wage rigidity bites harder for low education workers**
  - Productivity gains take longer to bring realignment
  - Probably more a story for unemployment

# LFP Gap By Age

(Actual LF – Predicted LF)

# Contribution to LFP Gap By Age

(LFP Gap \* Population Share)

# Possible Interpretation of Age Results

---

- **Young workers most affected by down turn**
  - Consistent with past research that entrants face disproportionate difficulties in poor labor markets
- **Young workers may also be returning to school**
  - Understandable given low opportunity costs
- **Older workers may be working more to compensate for negative shock to wealth**

## Contribution to 2012 LFP Gap, by sex/age/education

Group	2012 LFP Gap	Contribution to Total
<b>Total Gap:</b>	<b>-1.14%</b>	
<b>Female, 25-54, HS Grads</b>	<b>-2.14%</b>	<b>-0.14%</b>
<b>Male, 25-54, HS dropouts</b>	<b>-3.03%</b>	<b>-0.10%</b>
<b>Female, 25-54, Some college</b>	<b>-1.03%</b>	<b>-0.08%</b>
<b>Female, 25-54, HS dropouts</b>	<b>-2.74%</b>	<b>-0.07%</b>
<b>Male, 20-24, HS graduates</b>	<b>-4.07%</b>	<b>-0.06%</b>
<b>Female, 71-79, HS Grads</b>	<b>-2.34%</b>	<b>-0.06%</b>
<b>Male, 25-54, HS Grads</b>	<b>-0.71%</b>	<b>-0.06%</b>
<b>Male, 25-54, Some College</b>	<b>-0.81%</b>	<b>-0.05%</b>
<b>Female, 20-24, Some College</b>	<b>-1.88%</b>	<b>-0.04%</b>
<b>Female, 16-19, Some college</b>	<b>-8.67%</b>	<b>-0.04%</b>
<b>Male, 16-19, HS dropouts</b>	<b>-1.59%</b>	<b>-0.04%</b>
<b>Residual:</b> (Difference of above gaps to total)	<b>-0.40%</b>	

# Caveats on LFP Modeling

---

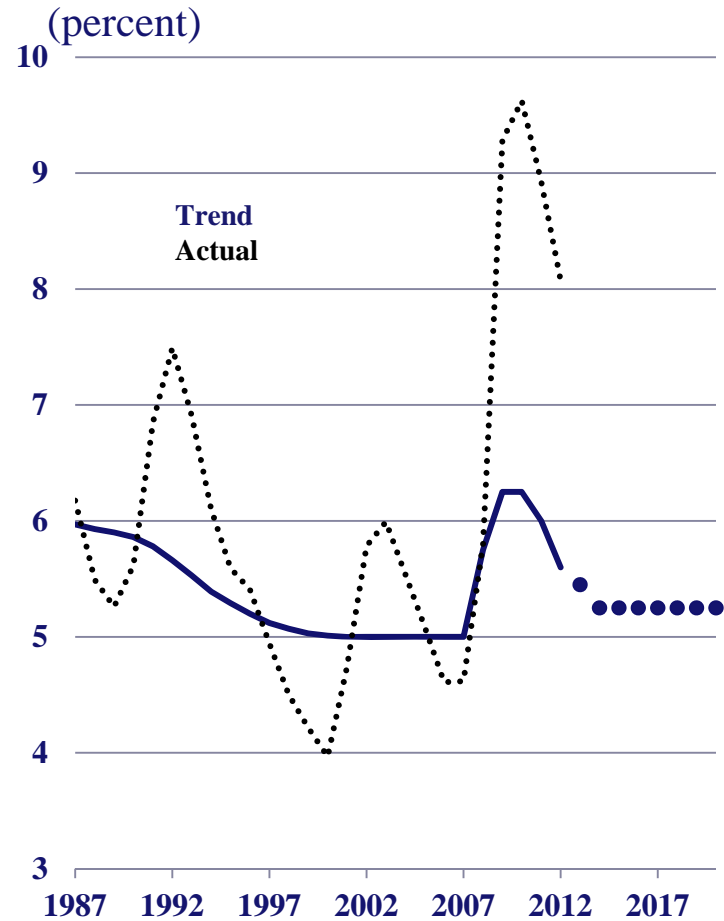

- **Modeling of business cycle could be improved**
  - E.g., some evidence that LFP responds to unemployment with very long lags
- **Could incorporate more effects of policy changes**
  - E.g., on SS, taxes, tuition, etc.
- **More generally, need better economics**
  - Labor supply responds to wages and other general equilibrium factors

# Unemployment Rate

**Population Growth, Trend vs. Actual**  
(percent)
