Motivation

- Credit cycles:
 - Good times:
 - Build up of leverage and large credit supply
 - Funding crisis:
 - Financial institutions hit their funding constraint
 - Shrinking credit supply sends economy into recession
- *Two* monetary tools: interest-rates and haircuts
- The haircut tool affects financial institutions' credit supply
 - Good times:
 - Impose regulatory capital requirements
 - Funding crisis:
 - Market-imposed funding requirements are binding
 - Lower haircuts using lending facilities

What We Do

- Theory: macro model with financial frictions:
 - Two types of agents facing margin constraints
 - Firms that differ in the haircut of their securities
 - Derive effect of margin constraints on required returns, real investment, and output
 - Effect of interest-rate cuts and haircut cuts
- Empirical evidence:
 - Unique survey evidence: how does demand for securities depend on haircuts?
 - Effect on market prices

Results: Theory

- Margin CAPM:

$$E_t(r^j) = r_t^f + \lambda_t \beta_t^j + \psi_t \times m_t^j$$

- Output and real investment decrease with credit constraints
- Propagation of business cycles:
binding constraint \rightarrow high required return \rightarrow low investment
 \rightarrow low future income \rightarrow future binding constraint \rightarrow ...
- Interest-rate cuts
 - Increase shadow cost of capital ψ_t , steepen the haircut-return relation
 - Can increase the required return and lower real investment for high-haircut assets
- Haircut cuts
 - Lower required returns in affected sectors
 - Large or broad cuts: Lower required returns in all sectors

Results: Empirical

- Survey evidence:
 - Bid price increases on average 18% with access to 3-year low-haircut loan
 - This reduces the yield by 3% for super senior bonds
- Response of market prices
 - Study of bonds that are rejected vs. accepted from TALF
 - TALF reduced yields by more than 0.40% (likely much more)
- Model:

$$E_t(r^j) = r_t^f + \lambda_t \beta_t^j + \psi_t \times m_t^j$$
$$\Delta E_t(r^j) \approx \psi_t \times \Delta m_t^j = 10\% \cdot 40\% \cdot (-80\%) = -3\%$$

Large effect on real investment, capital, and output

Related Literature

- Bagehot (1873): "If it is known that the Bank of England is freely advancing on what in ordinary times is reckoned a good security [...] the alarm of the solvent merchants and bankers will be stayed. [Otherwise] the alarm will not abate, the other loans made will fail in obtaining their end, and the panic will become worse and worse." (p. 198)

Model Setup: Agents

- Agents
 - Supply labor inelastically
 - Invest in securities with haircuts/margin requirements m_t^j
 - Choose portfolio to maximize utility subject to
margin requirement $\sum_j m_t^j |\theta^j| P_t^j \leq W_t^n$
- Agents differ in their risk aversion $\gamma^a > \gamma^b$:
 - Risk *a*verse: γ^a
 - Risk tolerant (*b*rave): γ^b
leveraged in equilibrium – hits his margin requirement
Lagrange multiplier ψ_t

Margin CAPM

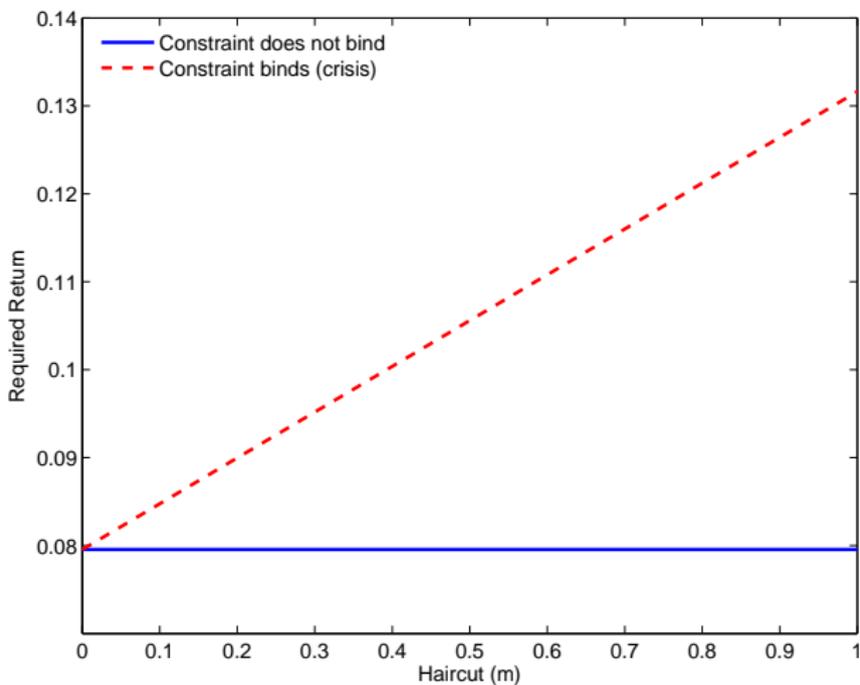

Proposition (Margin CAPM)

The required return on security i depends on its market beta and its margin requirement:

$$E_t(r_{t+1}^i) = r^f + \lambda_t \beta_t^i + m_t^i \psi_t x$$

where λ_t is covariance risk premium, ψ is the shadow cost of capital, and x is the importance of constrained agents.

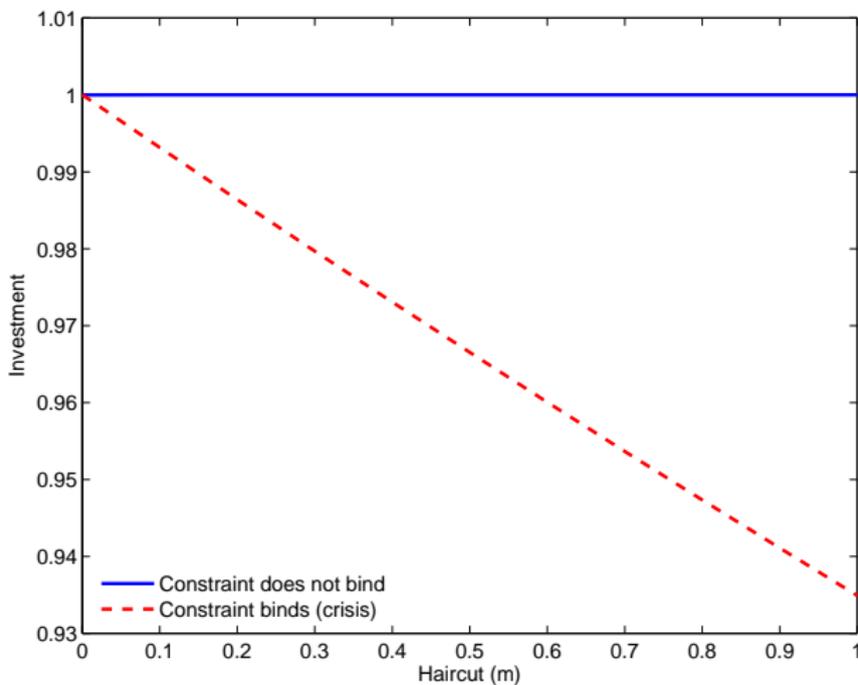

Margin CAPM

Model Setup: Firms, Output, and Real Investment

- Firms
 - Produce consumption goods using labor and capital
 - Face productivity shocks and choose labor to maximize profit
 - Choose real investment to maximize PV given required return
 - Financed by securities that differ in their haircuts (liquidity)

Haircuts and Real Investment

Margin-Constraint Accelerator

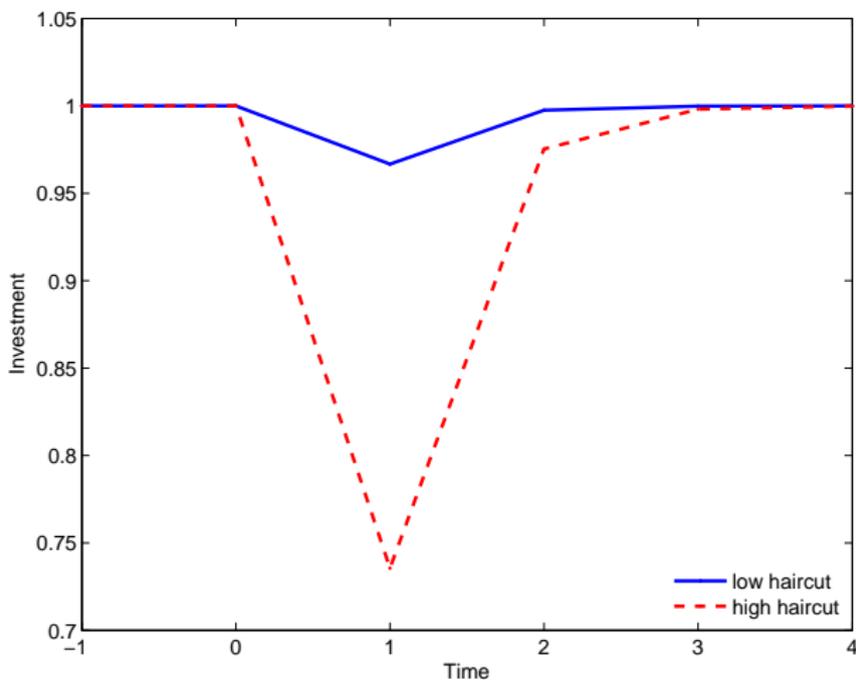

Proposition

- *Without margin constraints, i.i.d. productivity leads to i.i.d. output, wages, and income*
- *With margin constraints, output, income, real investment, consumption, wages, and risk premia are correlated over time.*

This follows from the propagation of a productivity shock that is so severe that investors' margin requirement binds:

- the required return increases
- reducing real investment
- reducing next period's expected output and income
- the low income then weakly increases the required return
- and so on

Margin-Constraint Accelerator

Interest Rate Cuts

Proposition

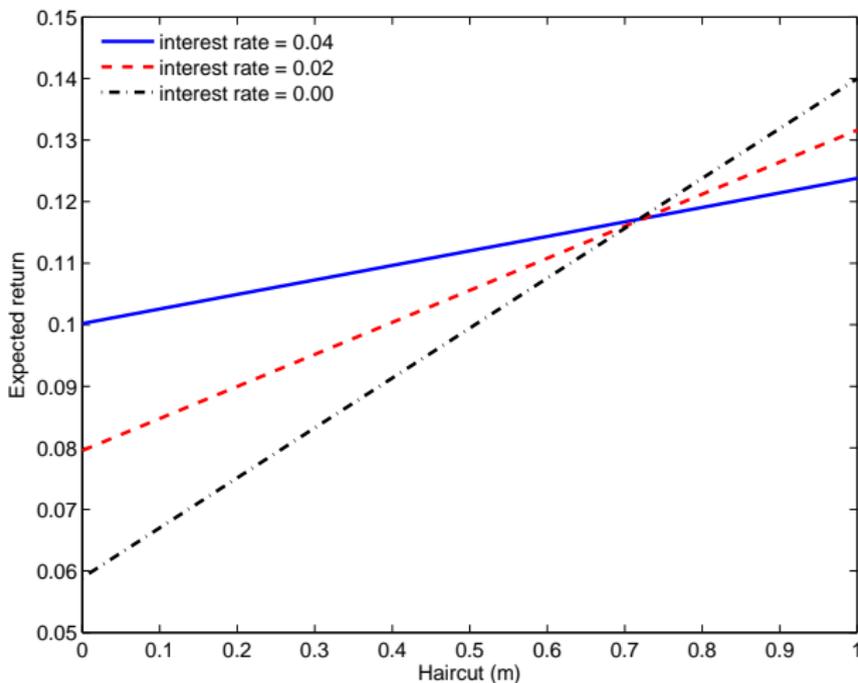

Suppose that the interest rate is reduced at time t when the constraint is binding. Then:

- *the required return decreases and real investment increases for assets with low haircuts ($m_t^j < \bar{m}_t$).*

If a agents are sufficiently risk averse

- *the shadow cost of capital ψ_t increases*
- *the required return increases and the real investment decreases for high-haircut assets ($m_t^j > \bar{m}_t$)*

Interest-Rate Cut: Steepening the Haircut-Return Curve

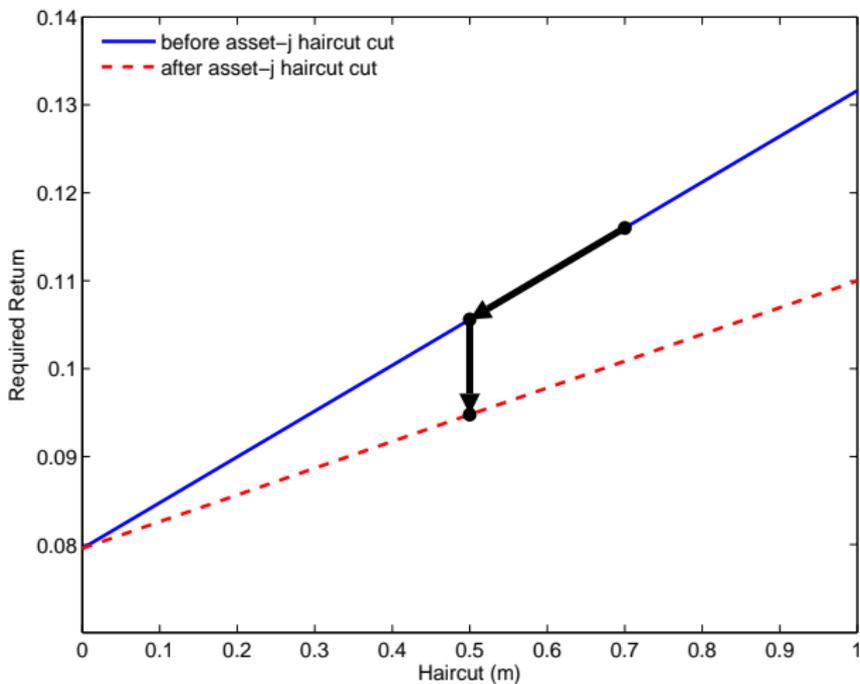

Haircut Cuts

Proposition

Suppose the haircut m_t^j on asset j is reduced at time t when the constraint is binding. Then:

- The required return for that asset decreases and its real investment increases. The real investments in other assets either all increase or all decrease.*
- If m_t^j is reduced sufficiently or if the haircuts on sufficiently many assets are reduced by a given fraction, then required returns on all assets decrease and their real investment increase.*

Haircut Cuts

Capital Injection and Asset Purchases

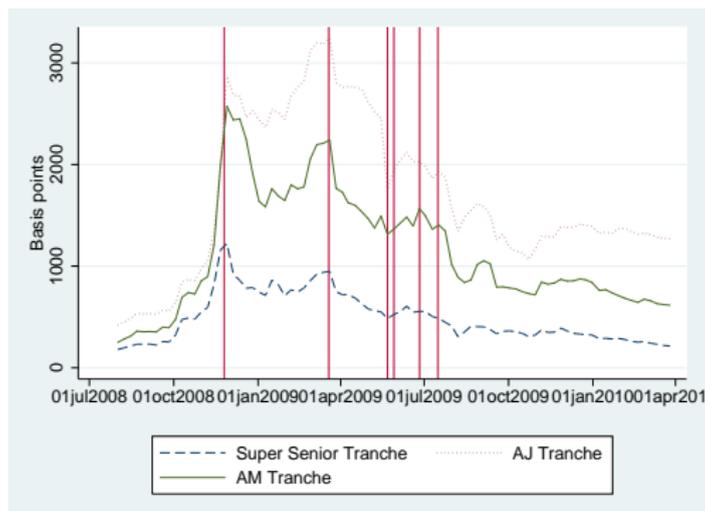

Proposition

- *If agent b 's wealth is increased, required returns go down and real investment increases for all assets.*
- *If the government buys shares in asset i , then the real investment in that asset increases and the investments in all other assets either all increase or decrease. If the government purchase is sufficiently large, then all real investments increase.*

Monetary Policy and Lending Facilities

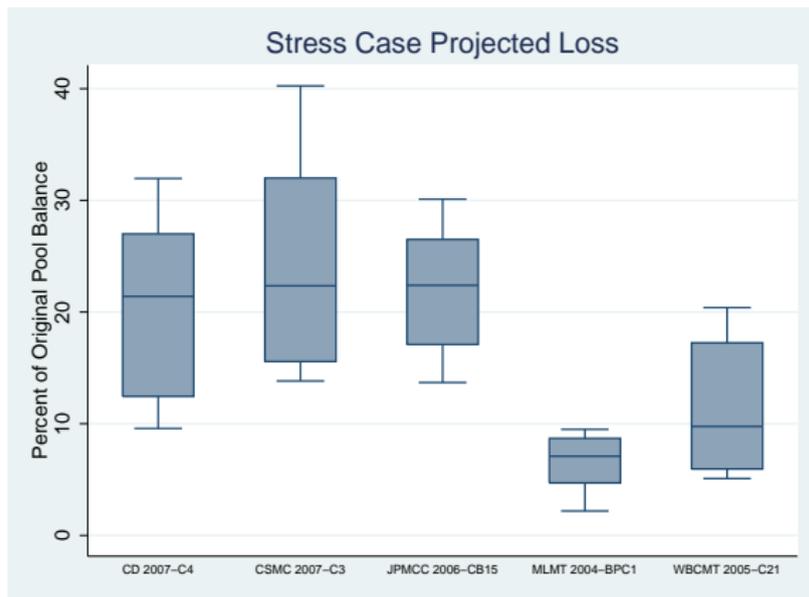

- Term Auction Facility (TAF) – 12/2007
- Term Securities Lending Facility (TSLF) – 3/2008
- Term Asset-Backed Securities Loan Facility (TALF) – 11/2008, 6/2009
- Goal: Improve funding conditions and “help market participants meet the credit needs of households and small businesses by supporting the issuance of asset-backed securities”
- The model suggests that when the Fed offers lower haircuts, required returns go down:
$$E(r^{i,Fed}) - E(r^{i,no Fed}) \approx \psi x (m^{Fed,i} - m^i) + \Delta \psi x m^i < 0$$
- I.e., ABS yield down, access to credit eases, helping the real economy

CMBS Yield Spreads

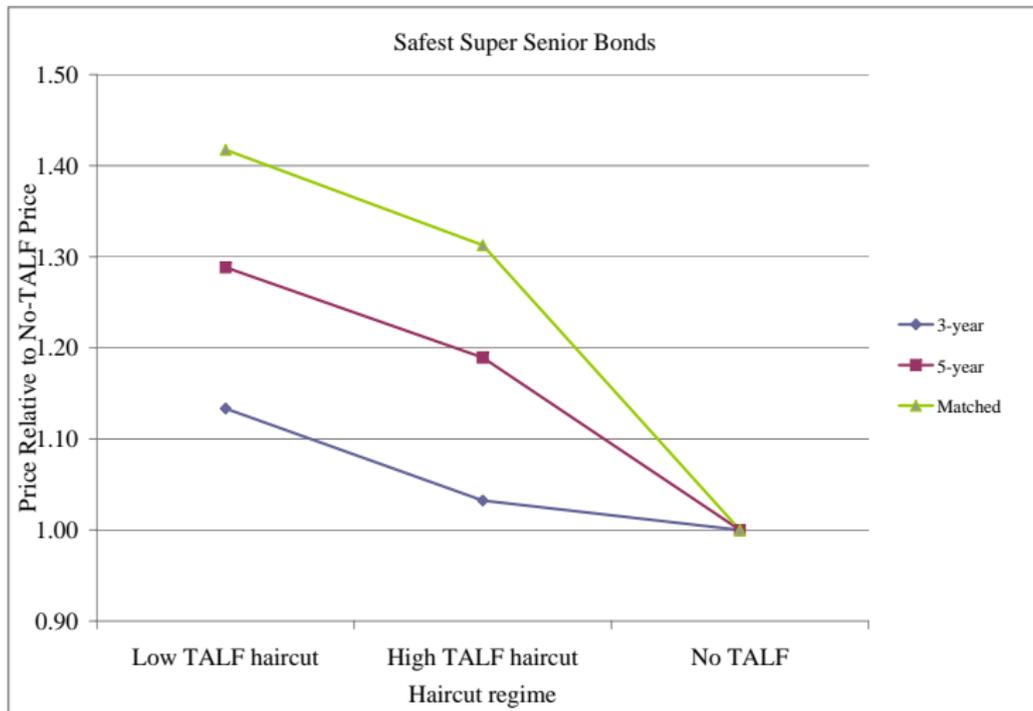

Date	Announcement
11/25/2008	Initial TALF for ABS, suggesting possible expansion for CMBS
3/19/2009	Legacy securities will be part of TALF
5/19/2009	Super senior legacy fixed-rate conduit CMBS eligible for TALF
5/26/2009	S&P considers methodology change for fixed-rate conduit CMBS
6/26/2009	S&P implements new methodology
7/16/2009	First subscription for legacy TALF

Potential Stress Loss for Each CMBS Pool

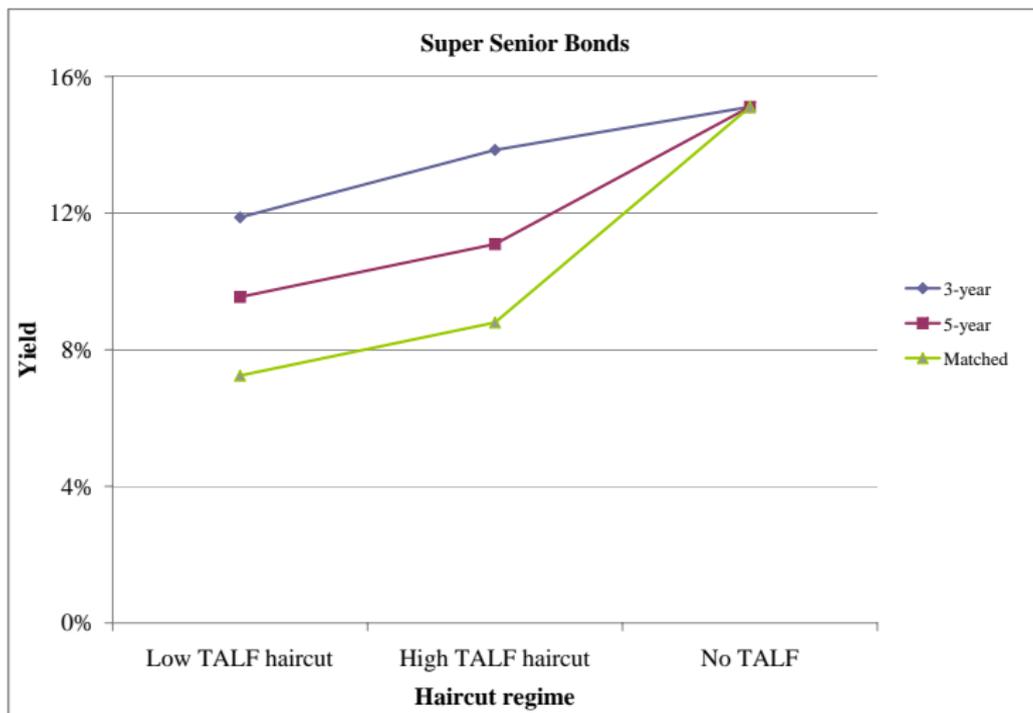

Most Pessimistic Participant: No Stress Loss for Safest Super Senior Bonds

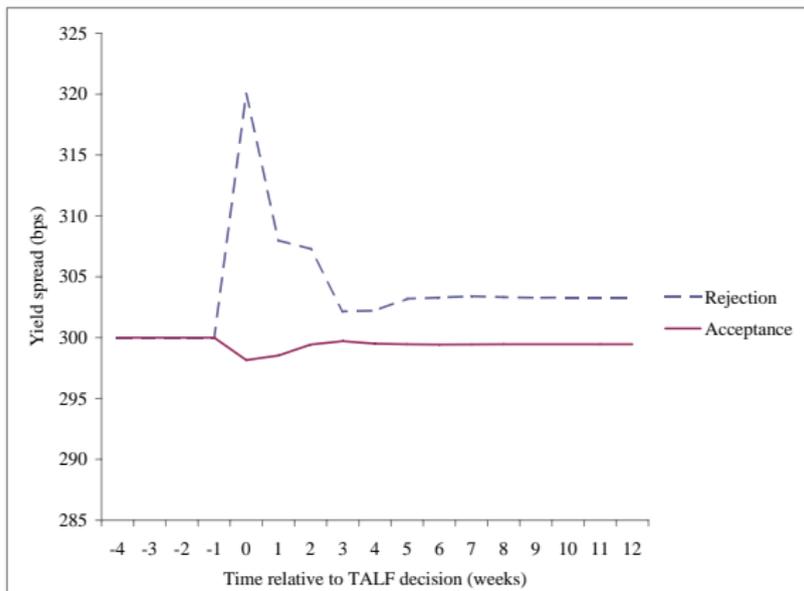

Survey Bid Price vs. Haircut

Implied Survey Yield vs. Haircut

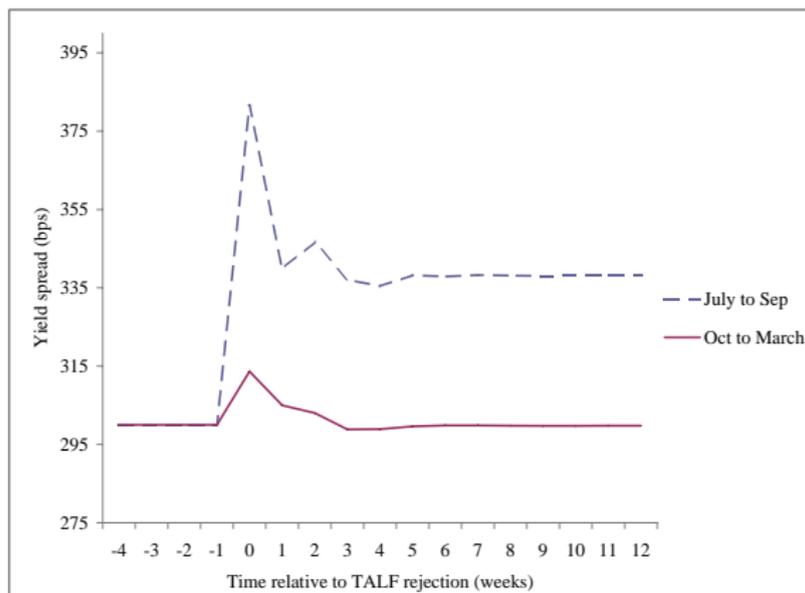

The Price Effect of TALF Rejections

- The yield spread of rejected bonds rises as these bonds will not benefit from the low haircuts provided by TALF
- Acceptance is expected and therefore associated with small effect

The Price Effect of TALF Rejections by Sub-Sample

- The effect of rejections is significantly larger July-September 2009 (the ending of the financial crisis) than October 2009-March 2010 (when conditions improved)
- Consistent with model's prediction that haircuts have a larger effect when capital constraints are tight

Regulatory Capital Requirements

- Basel requirement is similar to the margin constraint

$$\sum_i m^{Reg,i} |\theta^i| P^i \leq W$$

- Required return increased by $m^{Reg,i}\psi$
- Pressure to free capital by moving assets off the balance sheet or titling portfolios towards low capital-requirement assets
- Two monetary policy tools
 - 1 Interest rate
 - 2 Capital/margin requirement:
 - Good times: capital requirement
 - Bad times: lending facilities at moderate haircut

Haircuts Two Thousand Years Ago

- Use of haircuts:

“One lends money with a mortgage on land which is worth **more than** the value of the loan. The lender says to the borrower, ‘If you do not repay the loan within three years, this land is mine.’”

— Mishnah, circa 200 AD.

- Return the haircut?

“Rav Huna: If this condition was made when the money was given, then it is binding, even if the field is worth more than the loan. If the condition was made after the money was given, then the lender can only take **the portion of the land equivalent to the value of the loan.**”

— Talmud

Conclusion

- Binding margin requirements
 - Affects required returns
 - Propagates business cycles, esp. high-haircut sectors
- Interest-rate cuts:
 - Steepen haircut-return curve
- Haircut cuts:
 - Move assets down the haircut-return curve
 - Flatten the haircut-return curve itself
 - Effect of TALF, survey evidence: 3%
 - Effect of TALF, price effect of rejections: more than 0.40%
 - Large implied effect on investment, capital, and output
