Chicago Fed National Activity Index

Index suggests economic growth decreased substantially in March

Led by declines in production- and employment-related indicators, the Chicago Fed National Activity Index (CFNAI) fell to –4.19 in March from +0.06 in February. All four broad categories of indicators used to construct the index made negative contributions in March, and three of the four categories decreased from February. The index’s three-month moving average, CFNAI-MA3, decreased to –1.47 in March from –0.20 in February. Following a period of economic expansion, an increasing likelihood of a recession has historically been associated with a CFNAI-MA3 value below –0.70.

The CFNAI Diffusion Index, which is also a three-month moving average, moved down to –0.32 in March from –0.21 in February. Eighteen of the 85 individual indicators made positive contributions to the CFNAI in March, while 65 made negative contributions and two made neutral contributions. Twenty-two indicators improved from February to March, while 63 indicators deteriorated. Of the indicators that improved, nine made negative contributions.

What is the National Activity Index?
The index is a weighted average of 85 indicators of growth in national economic activity drawn from four broad categories of data: 1) production and income; 2) employment, unemployment, and hours; 3) personal consumption and housing; and 4) sales, orders, and inventories.

Why are there three index values?
Each month, we provide a monthly index (the CFNAI), its three-month moving average, and a diffusion index. Month-to-month movements can be volatile, so the monthly index’s three-month moving average, the CFNAI-MA3, provides a more consistent picture of national economic growth. The CFNAI Diffusion Index instead captures the degree to which a change in the monthly index is spread out among its 85 indicators, averaged over a three-month period.

What do the numbers mean?
A zero value for the monthly index has been associated with the national economy expanding at its historical trend (average) rate of growth; negative values with below-average growth (in standard deviation units); and positive values with above-average growth.

Periods of economic expansion have historically been associated with values of the CFNAI-MA3 above –0.70 and the CFNAI Diffusion Index above –0.35. Conversely, periods of economic contraction have historically been associated with values of the CFNAI-MA3 below –0.70 and the CFNAI Diffusion Index below –0.35.

An increasing likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +0.70 more than two years into an economic expansion. Similarly, a substantial likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +1.00 more than two years into an economic expansion.

The CFNAI Diffusion Index, above

Current and Previous values reflect index values as of the April 20, 2020, release and March 23, 2020, release, respectively. N/A indicates not applicable.

The next CFNAI will be released:
May 26, 2020
8:30 am Eastern Time
7:30 am Central Time

FEDERAL RESERVE BANK
OF CHICAGO
Production-related indicators contributed –2.72 to the CFNAI in March, down from +0.06 in February. Industrial production decreased 5.4 percent in March after increasing 0.5 percent in February. The contribution of the sales, orders, and inventories category to the CFNAI ticked up to –0.05 in March from –0.06 in February.

Employment-related indicators contributed –1.23 to the CFNAI in March, down from +0.07 in February. Nonfarm payrolls fell by 701,000 in March after increasing by 275,000 in February, and the unemployment rate increased to 4.4 percent in March from 3.5 percent in the previous month. The contribution of the personal consumption and housing category to the CFNAI decreased to –0.19 in March from –0.02 in February. Housing starts decreased to 1,216,000 annualized units in March from 1,564,000 in the previous month.

The CFNAI was constructed using data available as of April 16, 2020. At that time, March data for 50 of the 85 indicators had been published. For all missing data, estimates were used in constructing the index. The February monthly index value was revised to +0.06 from an initial estimate of +0.16, and the January monthly index value was revised to –0.27 from last month’s estimate of –0.33.

Revisions to the monthly index can be attributed to two main factors: revisions in previously published data and differences between the estimates of previously unavailable data and subsequently published data. The revision to the February monthly index value was primarily due to the former, while the revision to the January monthly index value was primarily due to the latter. In addition, this month the method to impute missing values was improved; for more details, see p. 7 of the background information document at chicagofed.org/cfnai.

Notes: Shading represents periods of sustained increasing inflation. An increasing likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +0.70 more than two years into an economic expansion. Similarly, a substantial likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +1.00 more than two years into an economic expansion.

Notes: Shading indicates official periods of recession as identified by the National Bureau of Economic Research. The CFNAI Diffusion Index represents the three-month moving average of the sum of the absolute values of the weights for the underlying indicators whose contribution to the CFNAI is positive in a given month less the sum of the absolute values of the weights for those indicators whose contribution is negative or neutral in a given month. Periods of economic expansion have historically been associated with values of the CFNAI Diffusion Index above –0.35.
