What is the National Activity Index?
The index is a weighted average of 85 indicators of growth in national economic activity drawn from four broad categories of data: 1) production and income; 2) employment, unemployment, and hours; 3) personal consumption and housing; and 4) sales, orders, and inventories.

Why are there three index values?
Each month, we provide a monthly index (the CFNAI), its three-month moving average, and a diffusion index. Month-to-month movements can be volatile, so the monthly index’s three-month moving average, the CFNAI-MA3, provides a more consistent picture of national economic growth. The CFNAI Diffusion Index instead captures the degree to which a change in the monthly index is spread out among its 85 indicators, averaged over a three-month period.

What do the numbers mean?
A zero value for the monthly index has been associated with the national economy expanding at its historical trend (average) rate of growth; negative values with below-average growth (in standard deviation units); and positive values with above-average growth.
Periods of economic expansion have historically been associated with values of the CFNAI-MA3 above –0.70 and the CFNAI Diffusion Index above –0.35. Conversely, periods of economic contraction have historically been associated with values of the CFNAI-MA3 below –0.70 and the CFNAI Diffusion Index below –0.35.
An increasing likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +0.70 more than two years into an economic expansion. Similarly, a substantial likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +1.00 more than two years into an economic expansion.

The next CFNAI will be released:
May 24, 2021
8:30 am Eastern Time
7:30 am Central Time

OF CHICAGO

Chicago Fed National Activity Index

Index suggests economic growth rebounded in March

Led by improvements in indicators related to production and personal consumption and housing, the Chicago Fed National Activity Index (CFNAI) rose to +1.71 in March from –1.20 in February. All four broad categories of indicators used to construct the index made positive contributions in March, and all four categories improved from February. The index’s three-month moving average, CFNAI-MA3, increased to +0.54 in March from +0.07 in February.

The CFNAI Diffusion Index, which is also a three-month moving average, moved up to +0.40 in March from +0.22 in February. Seventy of the 85 individual indicators made positive contributions to the CFNAI in March, while 15 made negative contributions. Sixty-nine indicators improved from February to March, while 16 indicators deteriorated. Of the indicators that improved, seven made negative contributions.

Current and Previous values reflect index values as of the April 22, 2021, release and March 22, 2021, release, respectively. N/A indicates not applicable.
Production-related indicators contributed +0.63 to the CFNAI in March, up from –1.04 in February. Manufacturing production rose 2.7 percent in March after falling 3.7 percent in February, and manufacturing capacity utilization increased by 1.9 percentage points in March. The contribution of the sales, orders, and inventories category to the CFNAI moved up to +0.11 in March from –0.06 in February. The Institute for Supply Management’s Manufacturing New Orders Index rose to 68.0 in March from 64.8 in the previous month.

The personal consumption and housing category contributed +0.63 to the CFNAI in March, up from –0.21 in February. The indicators in this category broadly improved from February. The contribution of the employment, unemployment, and hours category to the CFNAI increased to +0.34 in March from +0.12 in February. Nonfarm payrolls rose by 916,000 in March after increasing by 468,000 in February, and the unemployment rate decreased by 0.2 percentage points in March.

The CFNAI was constructed using data available as of April 20, 2021. At that time, March data for 50 of the 85 indicators had been published. For all missing data, estimates were used in constructing the index. The February monthly index value was revised to –1.20 from an initial estimate of –1.09, and the January monthly index value was revised to +1.10 from last month’s estimate of +0.75. Revisions to the monthly index can be attributed to two main factors: revisions in previously published data and differences between the estimates of previously unavailable data and subsequently published data. The revision to the February monthly index value was primarily due to the former, while the revision to the January monthly index value was primarily due to the latter.

The CFNAI-MA3 and Inflation Cycles

Notes: Shading represents periods of sustained increasing inflation. An increasing likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +0.70 more than two years into an economic expansion. Similarly, a substantial likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +1.00 more than two years into an economic expansion.

The CFNAI-MA3 and Business Cycles

Notes: Shading indicates official periods of recession as identified by the National Bureau of Economic Research; the vertical line indicates the most recent business cycle peak. Following a period of economic expansion, an increasing likelihood of a recession has historically been associated with a CFNAI-MA3 value below –0.70. Conversely, following a period of economic contraction, an increasing likelihood of an expansion has historically been associated with a CFNAI-MA3 value above +0.20.

The CFNAI Diffusion Index

Notes: Shading indicates official periods of recession as identified by the National Bureau of Economic Research; the vertical line indicates the most recent business cycle peak. The CFNAI Diffusion Index represents the three-month moving average of the sum of the absolute values of the weights for the underlying indicators whose contribution to the CFNAI is positive in a given month less the sum of the absolute values of the weights for those indicators whose contribution is negative or neutral in a given month. Periods of economic expansion have historically been associated with values of the CFNAI Diffusion Index above –0.35.
