What is the National Activity Index?
The index is a weighted average of 85 indicators of growth in national economic activity drawn from four broad categories of data: 1) production and income; 2) employment, unemployment, and hours; 3) personal consumption and housing; and 4) sales, orders, and inventories.

Why are there three index values?
Each month, we provide a monthly index (the CFNAI), its three-month moving average, and a diffusion index. Month-to-month movements can be volatile, so the monthly index's three-month moving average, the CFNAI-MA3, provides a more consistent picture of national economic growth. The CFNAI Diffusion Index instead captures the degree to which a change in the monthly index is spread out among its 85 indicators, averaged over a three-month period.

What do the numbers mean?
A zero value for the monthly index has been associated with the national economy expanding at its historical trend (average) rate of growth; negative values with below-average growth (in standard deviation units); and positive values with above-average growth.

Periods of economic expansion have historically been associated with values of the CFNAI-MA3 above –0.70 and the CFNAI Diffusion Index above –0.35. Conversely, periods of economic contraction have historically been associated with values of the CFNAI-MA3 below –0.70 and the CFNAI Diffusion Index below –0.35.

An increasing likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +0.70 more than two years into an economic expansion. Similarly, a substantial likelihood of a period of sustained increasing inflation has historically been associated with values of the CFNAI-MA3 above +1.00 more than two years into an economic expansion.

The next CFNAI will be released:
April 22, 2021
8:30 am Eastern Time
7:30 am Central Time

Chicago Fed National Activity Index

Index suggests economic growth declined in February

Led by declines in indicators related to production and personal consumption and housing, the Chicago Fed National Activity Index (CFNAI) fell to −1.09 in February from +0.75 in January. Two of the four broad categories of indicators used to construct the index made negative contributions in February, but all four categories decreased from January. The index’s three-month moving average, CFNAI-MA3, decreased to −0.02 in February from +0.46 in January.

The CFNAI Diffusion Index, which is also a three-month moving average, moved down to +0.17 in February from +0.34 in January. Thirty-four of the 85 individual indicators made positive contributions to the CFNAI in February, while 51 made negative contributions. Thirty indicators improved from January to February, while 55 indicators deteriorated. Of the indicators that improved, eight made negative contributions.
Production-related indicators contributed –0.85 to the CFNAI in February, down from +0.37 in January. Adverse weather played a part in industrial production declining 2.2 percent in February, after rising 1.1 percent in January. The contribution of the sales, orders, and inventories category to the CFNAI edged down to +0.03 in February from +0.06 in January.

The personal consumption and housing category contributed –0.29 to the CFNAI in February, down from +0.27 in January. The indicators in this category broadly deteriorated from January. The contribution of the employment, unemployment, and hours category to the CFNAI edged down +0.02 in February from +0.04 in January. Notably, payrolls in construction and average weekly hours worked in manufacturing declined in February.

The CFNAI was constructed using data available as of March 18, 2021. At that time, February data for 51 of the 85 indicators had been published. For all missing data, estimates were used in constructing the index. The January monthly index value was revised to +0.75 from an initial estimate of +0.66, and the December monthly index value was revised to +0.28 from last month’s estimate of +0.41. Revisions to the monthly index can be attributed to two main factors: revisions in previously published data and differences between the estimates of previously unavailable data and subsequently published data. The revisions to both the January and December monthly index values were primarily due to the former.
