What is the *Survey of Business Conditions*?

To support its Beige Book efforts, the Chicago Fed gathers information from its business contacts using an online survey system. Respondents are asked to rate various aspects of business conditions along a seven-point scale ranging from “substantially increased” to “substantially decreased.” A series of diffusion indexes summarizing the distribution of responses is then calculated.

How are the indexes constructed?

Respondents’ answers on the seven-point scale are assigned a numeric value ranging from +3 to -3. Each diffusion index is calculated as the difference between the number of respondents with answers above their respective average responses and the number of respondents with answers below their respective average responses, divided by the total number of respondents. The index is then multiplied by 100 so that it ranges from +100 to -100 and will be +100 if every respondent provides an above-average answer and -100 if every respondent provides a below-average answer. Respondents with no prior history of responses are excluded from the calculation.

What do the numbers mean?

Respondents’ respective average answers to a question can be interpreted as representing their historical trends or long-run averages. Thus, zero index values indicate that, on balance, activity, hiring, capital spending, and cost pressures are growing at their trend rates or that outlooks are neutral. Positive index values indicate above-average growth (or optimistic outlooks) on balance, and negative values indicate below-average growth (or pessimistic outlooks) on balance.

Chicago Fed Survey of Business Conditions

Survey shows steady growth in January and early February

The *Chicago Fed Survey of Business Conditions* (CFSBC) Activity Index edged down to +22 from +25, suggesting that growth in economic activity continued at a moderate pace in January and early February. The CFSBC Manufacturing Activity Index moved down to +38 from +49, and the CFSBC Nonmanufacturing Activity Index remained at +11.

- Respondents’ outlooks for the U.S. economy for the next six to 12 months deteriorated some, but remained quite optimistic on balance. Respondents with optimistic outlooks highlighted the federal tax reform, good economic data, and increased demand for their firms’ products. Respondents with pessimistic outlooks were concerned that rising interest rates could slow short-term growth and that the rising federal deficit could slow long-term growth.
- The pace of current hiring picked up, as did respondents’ expectations for the pace of hiring over the next six to 12 months. The hiring index rose to a neutral level, and the hiring expectations index moved into positive territory.
- The pace of current capital spending increased, but respondents’ expectations for the pace of capital spending over the next six to 12 months declined some. While the current capital spending index remained negative, the capital spending expectations index stayed positive.
- The wage cost pressures index decreased and moved into negative territory. In contrast, the nonwage cost pressures index increased and continued to be positive.

Activity Indexes: Overall and by Sector

Manufacturing

Nonmanufacturing

Additional Survey Results

Activity

Hiring

Occupations (%)

Capital Spending

Spending for (%)

Spending on (%)

Cost Pressures

Increasing Wage Costs (%)

Increasing Nonwage Costs (%)

NOTES: Positive readings of the current activity, hiring, capital spending, and wage and nonwage cost pressures indexes indicate that more respondents reported above-average growth at their respective firms than below-average growth in current activity, hiring, capital spending, and wage and nonwage cost pressures. Positive readings of the planned hiring and capital spending indexes indicate similar outcomes for questions pertaining to expectations for hiring and capital spending in the next six to 12 months. Positive readings of the outlook index indicate more respondents reported above-average outlooks for the U.S. economy over the next six to 12 months than below-average ones. The bar charts report the percentage of responses for types of occupations currently in demand; reasons for capital spending and its allocation; and sources of increasing wage and nonwage cost pressures. The numbers may add up to more than 100 percent because more than one option can be chosen.
