What is the Midwest Economy Index?
The index is a weighted average of 129 state and regional indicators encompassing the entirety of the five states in the Seventh Federal Reserve District (Illinois, Indiana, Iowa, Michigan, and Wisconsin). The index measures growth in nonfarm business activity based on indicators of four broad sectors of the Midwest economy: 1) manufacturing, 2) construction and mining, 3) services, and 4) consumer spending.

Why are there two index values?
Over long periods, growth in Midwest economic activity has tended to coincide with growth in national economic activity. However, over shorter periods of time this has not always been the case. To highlight such differences, we construct two separate index values. The MEI captures both national and regional factors driving Midwest growth, and the relative MEI provides a picture of Midwest growth conditions relative to those of the nation.

What do the index numbers mean?
A zero value for the MEI indicates that the Midwest economy is expanding at its historical trend rate of growth; positive values indicate above-average growth; and negative values indicate below-average growth. A zero value for the relative MEI indicates that the Midwest economy is growing at a rate historically consistent with the growth of the national economy; positive values indicate above-average relative growth; and negative values indicate below-average relative growth.

Index shows Midwest economic growth increased in July

The Midwest Economy Index (MEI) increased to +0.25 in July from –0.11 in June, and the relative MEI rose to +0.45 in July from –0.16 in June. July’s value for the relative MEI indicates that Midwest economic growth was somewhat higher than would typically be suggested by the growth rate of the national economy.

The next MEI will be released:
September 30, 2013
8:30 am Eastern Time
7:30 am Central Time

FEDERAL RESERVE BANK OF CHICAGO
Manufacturing’s contribution to the MEI decreased slightly to +0.06 in July from +0.07 in June. The pace of manufacturing activity decreased in Iowa and Michigan, but increased in Wisconsin and was unchanged in Indiana and Illinois. Manufacturing’s contribution to the relative MEI moved down to –0.01 in July from a neutral value in June.

The construction and mining sector’s contribution to the MEI moved up to –0.16 in July from –0.21 in June. The pace of construction and mining activity was lower in Indiana, but higher in Illinois, Iowa, and Michigan and unchanged in Wisconsin. Construction and mining’s contribution to the relative MEI increased to –0.10 in July from –0.18 in June.

The service sector contributed +0.26 to the MEI in July, up from –0.05 in June. The pace of service sector activity increased in all five Seventh District states. The service sector’s contribution to the relative MEI increased to +0.48 in July from –0.10 in June.

The contribution from consumer spending indicators to the MEI was unchanged at +0.08 in July. Consumer spending indicators were, on balance, up in Illinois and Wisconsin, down in Iowa and Michigan, and unchanged in Indiana. Consumer spending’s contribution to the relative MEI decreased to +0.09 in July from +0.12 in June.

Notes: Both the MEI and the CFNAI-MA3 have been standardized to have a zero mean and are expressed in standard deviation units. MEI values greater than zero indicate growth in Midwest economic activity above its historical trend, and CFNAI-MA3 values greater than zero indicate growth in national economic activity above its historical trend; negative values indicate the opposite. Shading indicates official periods of recession as identified by the National Bureau of Economic Research.

Notes: Both the relative MEI and the CFNAI-MA3 have been standardized to have a zero mean and are expressed in standard deviation units. The relative MEI is constructed from the standardized residuals from linear regressions of each of the 129 MEI indicators on the CFNAI-MA3. Relative MEI values greater than zero indicate that growth in Midwest economic activity is higher on average than would typically be suggested based on the CFNAI-MA3; negative values indicate the opposite. Shading indicates official periods of recession as identified by the National Bureau of Economic Research.
