What is the Midwest Economy Index?
The index is a weighted average of 129 state and regional indicators encompassing the entirety of the five states in the Seventh Federal Reserve District (Illinois, Indiana, Iowa, Michigan, and Wisconsin). The index measures growth in nonfarm business activity based on indicators of four broad sectors of the Midwest economy: 1) manufacturing, 2) construction and mining, 3) services, and 4) consumer spending.

Why are there two index values?
Over long periods, growth in Midwest economic activity has tended to coincide with growth in national economic activity. However, over shorter periods of time this has not always been the case. To highlight such differences, we construct two separate index values. The MEI captures both national and regional factors driving Midwest growth, and the relative MEI provides a picture of Midwest growth conditions relative to those of the nation.

What do the index numbers mean?
A zero value for the MEI indicates that the Midwest economy is expanding at its historical trend rate of growth; positive values indicate above-average growth; and negative values indicate below-average growth. A zero value for the relative MEI indicates that the Midwest economy is growing at a rate historically consistent with the growth of the national economy; positive values indicate above-average relative growth; and negative values indicate below-average relative growth.

The Midwest Economy Index (MEI) decreased to +0.55 in August from +0.63 in July, but remained above average for the fifth straight month. The relative MEI edged down to +0.26 in August from +0.31 in the previous month. August’s value for the relative MEI indicates that Midwest economic growth was somewhat higher than would typically be suggested by the growth rate of the national economy.
Manufacturing’s contribution to the MEI edged down to +0.30 in August from +0.35 in July. The pace of manufacturing activity decreased in Iowa, Michigan, and Wisconsin, but increased in Illinois and was unchanged in Indiana. Manufacturing’s contribution to the relative MEI decreased to +0.17 in August from +0.18 in July.

The construction and mining sector’s contribution to the MEI ticked up to +0.03 in August from +0.01 in July. The pace of construction and mining activity was higher in Illinois and Indiana, but lower in Iowa and unchanged in Michigan and Wisconsin. Construction and mining’s contribution to the relative MEI remained at +0.08 in August.

The service sector contributed +0.15 to the MEI in August, up slightly from +0.14 in July. The pace of service sector activity increased in Illinois and Iowa, but decreased in Indiana, Michigan, and Wisconsin. The service sector’s contribution to the relative MEI increased to +0.04 in August from +0.03 in July.

The contribution from consumer spending indicators to the MEI moved down to +0.06 in August from +0.13 in July. Consumer spending indicators were, on balance, down in Illinois, Indiana, Iowa, and Michigan, but steady in Wisconsin. Consumer spending’s contribution to the relative MEI decreased to −0.03 in August from +0.01 in July.

Notes: Both the MEI and the CFNAI-MA3 have been standardized to have a zero mean and are expressed in standard deviation units. MEI values greater than zero indicate growth in Midwest economic activity above its historical trend, and CFNAI-MA3 values greater than zero indicate growth in national economic activity above its historical trend; negative values indicate the opposite. Shading indicates official periods of recession as identified by the National Bureau of Economic Research.

Notes: Both the relative MEI and the CFNAI-MA3 have been standardized to have a zero mean and are expressed in standard deviation units. The relative MEI is constructed from the standardized residuals from linear regressions of each of the 129 MEI indicators on the CFNAI-MA3. Relative MEI values greater than zero indicate that growth in Midwest economic activity is higher on average than would typically be suggested based on the CFNAI-MA3; negative values indicate the opposite. Shading indicates official periods of recession as identified by the National Bureau of Economic Research.
