What is the Midwest Economy Index?
The index is a weighted average of 129 state and regional indicators encompassing the entirety of the five states in the Seventh Federal Reserve District (Illinois, Indiana, Iowa, Michigan, and Wisconsin). The index measures growth in nonfarm business activity based on indicators of four broad sectors of the Midwest economy: 1) manufacturing, 2) construction and mining, 3) services, and 4) consumer spending.

Why are there two index values?
Over long periods, growth in Midwest economic activity has historically tended to coincide with growth in national economic activity. However, over shorter periods of time this has not always been the case. To highlight such differences, we construct two separate index values. The MEI captures both national and regional factors driving Midwest growth, and the relative MEI provides a picture of Midwest growth conditions relative to those of the nation.

What do the index numbers mean?
A zero value for the MEI has been associated with the Midwest economy expanding at its historical trend (average) rate of growth; positive values with above-average growth (in standard deviation units); and negative values with below-average growth. A zero value for the relative MEI has been associated with the Midwest economy growing at a rate historically consistent with the growth of the national economy; positive values with above-average relative growth (in standard deviation units); and negative values with below-average relative growth.

The next MEI will be released: December 31, 2018
8:30 am Eastern Time
7:30 am Central Time

Midwest Economy Index

Index points to slower Midwest economic growth in October

The Midwest Economy Index (MEI) moved down to +0.23 in October from +0.31 in September. Contributions to the October MEI from all four broad sectors of nonfarm business activity and three of the five Seventh Federal Reserve District states decreased from September. The relative MEI declined to -0.22 in October from -0.11 in September. Contributions to the October relative MEI from all four sectors and two of the five states decreased from September.

Notes: The table summarizes the most recent contribution to the MEI and relative MEI by sector and geography. The sectoral (rows) and geographic (columns) contributions may not sum to the index in each time period because of rounding. Manufacturing and construction and mining are composed of production and employment indicators. Services contains only employment indicators, while consumer spending contains employment, unemployment, per capita personal income, and home and retail sales indicators.
The manufacturing sector’s contribution to the MEI edged down to +0.27 in October from +0.29 in September. The pace of manufacturing activity decreased in Michigan and Wisconsin, but was unchanged in Illinois, Indiana, and Iowa. Manufacturing’s contribution to the relative MEI moved down to +0.12 in October from +0.21 in September.

The construction and mining sector contributed +0.02 to the MEI in October, down slightly from +0.03 in September. The pace of construction and mining activity was slower in Michigan, but faster in Indiana and unchanged in Illinois, Iowa, and Wisconsin. The contribution from construction and mining to the relative MEI edged down to +0.02 in October from +0.04 in September.

The service sector's contribution to the MEI edged down to –0.07 in October from –0.05 in September. The pace of service sector activity was down in Illinois, Michigan, and Wisconsin, but up in Indiana and unchanged in Iowa. The service sector’s contribution to the relative MEI ticked down to –0.36 in October from –0.35 in September.

The contribution from consumer spending indicators to the MEI moved down to +0.02 in October from +0.05 in September. Consumer spending indicators were, on balance, down in Illinois, Michigan, and Wisconsin, but steady in Indiana and Iowa. Consumer spending's contribution to the relative MEI ticked down to –0.01 in October from a neutral reading in September.

Notes: Both the MEI and the CFNAI-MA3 have been standardized to have a zero mean and are expressed in standard deviation units. MEI values greater than zero point to growth in Midwest economic activity above its historical trend, and CFNAI-MA3 values greater than zero point to growth in national economic activity above its historical trend; negative values suggest the opposite. Shading indicates official periods of recession as identified by the National Bureau of Economic Research.
